Dry down

Mellemtyper mellem dry down og stay green typer

5 høsttidspunkter

- Omkring 1/9 - slutningen af oktober
- 2 uger i mellem

Lejesæd, 2022

Pct. tørstof, 2021

Pct. tørstof, 2022

Pct. tørstof

- Kun lille forskel ved 25 % tørstof – 2-4 procentpoint
- Derefter større og større forskel
- Under varme forhold er tørstofprocenten dagligt steget med 0,5-0,8 – mest i de tidligste sorter
- Under kølige forhold er tørstofprocenten dagligt steget med 0,2-0,6 – mest i de tidligste sorter
- Dobbelt så stor sikkerhed for at få meget tidlige sorter moden i et køligt år

350 Kha in 22/23

One in two farmers harvest at the wrong maturity

Strong impact on quality and profitability

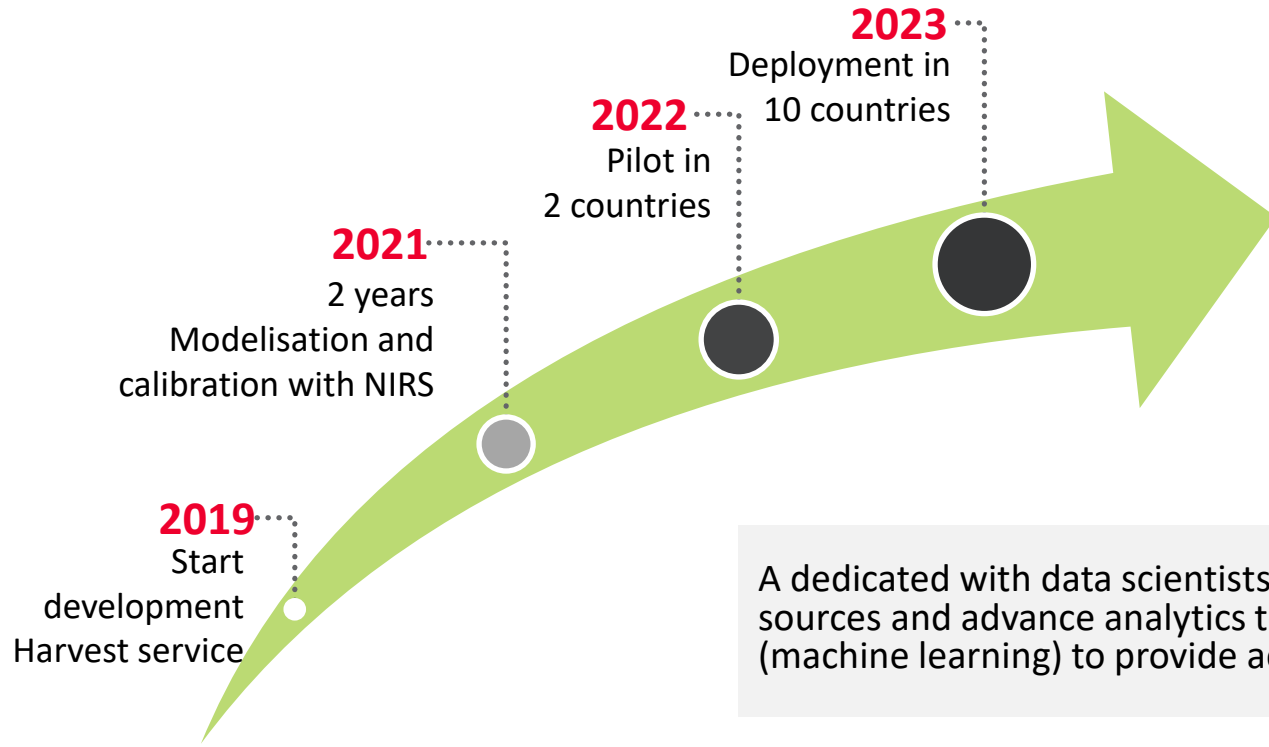

Distribution of samples according to whole plant dry matter (%)
45% between 30% and 36% of DM

Source LG: 1655 samples- year 2021 in FR

- 45% of samples within the recommended harvest window (30-36% MS)
- 55% who don't harvest at the right maturity
- Impact of bad DM:
 - DM > 35%
 - Difficulty compacting the silo
 - Difficulty of conservation
 - Penalized organic digestibility
 - DM < 30%
 - Loss in the silo in the form of juice

A dedicated with data scientists combining data from diverse sources and advance analytics to enable predictive modeling (machine learning) to provide actionable insights to farmers

Key components to create your harvest prescription

Science combined with new technologies

Field data

- Field boundaries
- Crop and Variety Name
- Irrigation
- Sowing date and seedrate
- Pre-filled soil characteristics

Weather data

- Daily data to calculate daily GDD and DM
- Historical data to predict climatic scenario

Variety knowledge

- More than 800 dry matter data from farmer fields
- Multi year data
- Maturity

Agronomic models

- Predict the evolution of crop stages and DM
- An ecophysiological model

Satellite images

- Leaves DM correction
- Specific index taking into account Biomass and Water Status

Service delivery

Email report

Platform

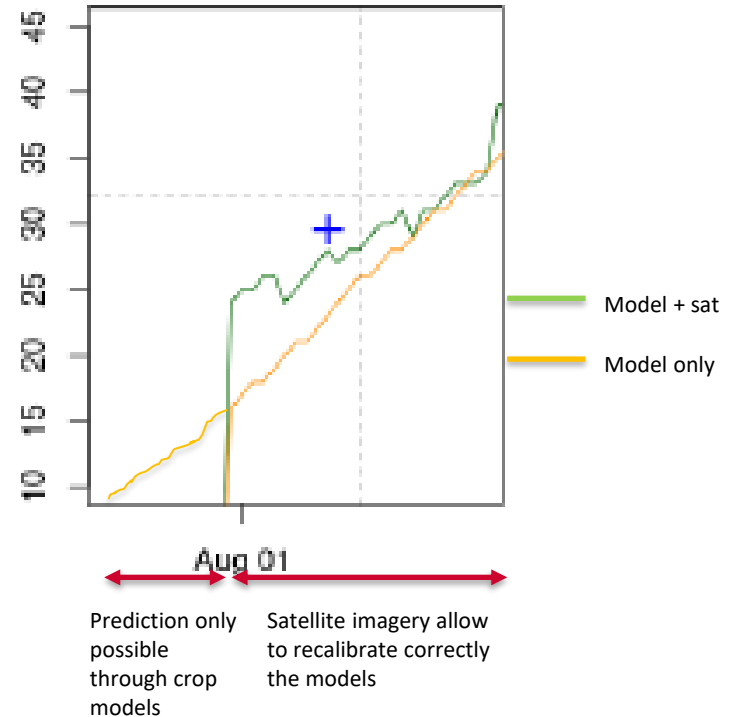

Satellite imagery and models to obtain the best prediction

A complete system based on 2 models to secure the prediction during the season

- Interest of the combination:
 - Crop model: can give an idea of the optimal date really early on the season
 - Satellite imagery: will allow to be more precise on the last 3 weeks before the harvest → increase the accuracy of the prediction of 15-20%

Continuous improvement of calibration till 2020

Average deviation: 2,5 to 3 % DM

- More than 800 dry matter data from farmer fields
- Learning machine system
- 72 000 points in Europe (real or virtual)

Country	Average deviation 4 %DM		Average deviation 3 %DM		Average deviation 3 %DM		Farmer Feedback
	2020		2021		2022		
	Samples	Average deviation	Samples	Average deviation	Samples	Average deviation

Customer voice- User case

EILYPS (FR) – Independant advisor

- Partnerships started in 2022, specialist in sales of services for cattle
- Evolution till 2022:
 - 2022: Pilot : 50 farmers, 1300 Ha
 - 2023: 3 départements : 500 farmers, 13000 Ha
 - 2024: Long term agreement
- Testimonies with high level of satisfaction of farmer (more than 90% of renewal) and advisors

Easy way from data capture to results delivery

A precise « field » diagnosis

Field boundaries

5 field data

- Crop
- Variety
- Irrigation
- sowing date
- Seedrate
- Pre-filled soil characteristic data (rooting depth, granulometry, composition)

Early service delivery
One month before harvest

Email report

DAILY UPDATE ON PLATFORM

Harvest report in PDF

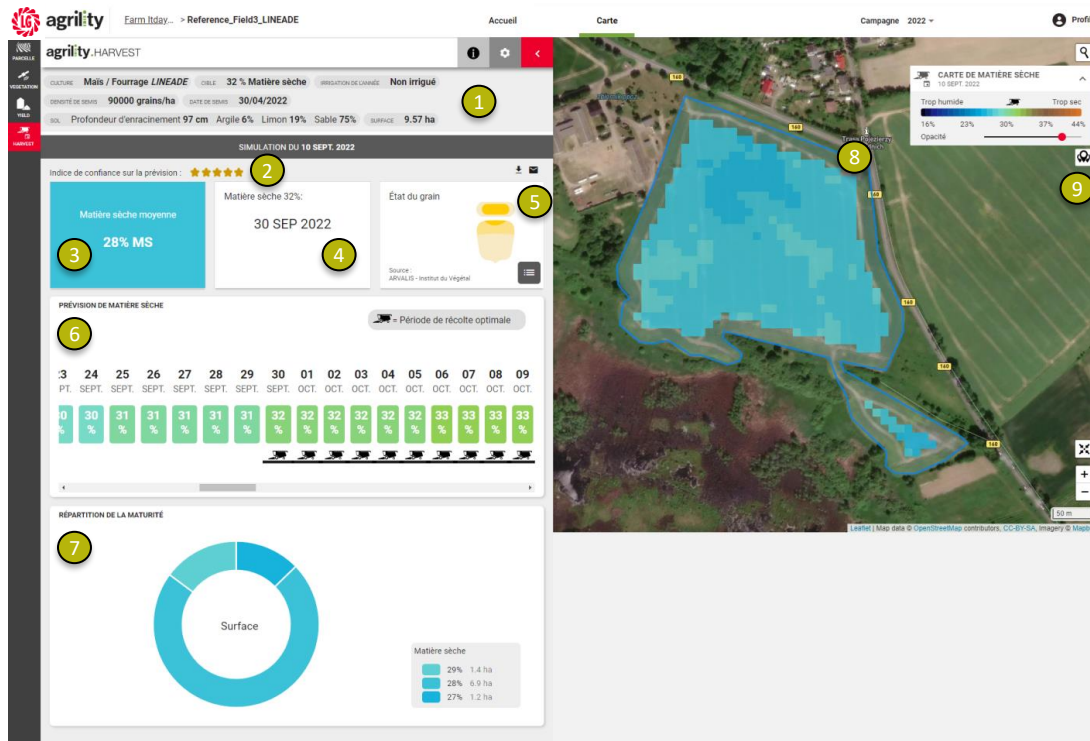

A simple overview for a global analysis

- 1 Estimated grain stage
- 2 Estimated harvest time at 32% DM
- 3 Updated average dry matter of crop (to date)
- 4 Confidence index that reflects the precision of harvest estimation
- 5 Estimated harvest agenda
- 6 Dry matter map
- 7 Distribution of each zone with different dry matter value in the field
- 8 Crop information

Follow-up during the season

A full picture at field level with simple criteria

- 1 Crop information
- 2 Confidence index that reflects the precision of harvest estimation
- 3 Updated average dry matter of crop (to date)
- 4 Estimated harvest time at 32% DM
- 5 Estimated grain stage
- 6 Estimated harvest agenda
- 7 Distribution of each zone with different dry matter value in the field
- 8 Dry matter map (resolution of 10x10 m)
- 9 Overview of the dry matter of all the fields in the farm

Key messages

- Multi-year experience with diverse climatic scenario
- High silage expertise
- Deep and mature agronomic modelisation
- High precision prediction from 1 month before harvest (2,5-3% DM)
- High farmer satisfaction with recognized added value across Europe
